                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FOORI: Plants were grown under six following different environmental regimes in greenhouse, Environment 1)
240c/Inoc day/Anight, well-watered, with post-anthesis fertilizer, Environment 2) 240c/Inoc day/Anight, well-watered, without post-anthesis fertilizer, Environment 2) 370c/Inoc day/Anight, well-watered, without post-anthesis fertilizer, Environment 4) 370c/Inoc day/Anight, well-watered, without post-anthesis fertilizer, Environment 5) 370c/Inoc day/Anight plus drought, without post-anthesis fertilizer, Environment 6) 370c/Inoc day/Anight plus drought, without post-anthesis fertilizer, developing wheat grains from the following were excised and frozen in liquid nitrogen, Environment 1 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 36, 40, 44 DPA Environment 2 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 30 DPA Environment 5 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 30 DPA Environment 5 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 30 DPA Environment 5 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 30 DPA Environment 5 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 30 DPA Environment 5 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 30 DPA Environment 5 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 30 DPA Environment 5 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 30 DPA Environment 5 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 30 DPA Environment 5 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 30 DPA and total RNA was prepared by S. Altenbach and K. Cronin at USDA-ARS, Albany, CA. A conn at USDA-ARS, Hibrary was made using poly (A) RNA, and the cDNA clones were in vivo excised to give plauescript SK(-) phagemids in the TJ Close lab (Chin, Close, Fenton) at the University of California, Riverside Fenton) at the
                                                                                                                                                                                                                                                                                                                             ยบองงาบ/

//note="Vector: Lambda ZAP II, excised phagemid; Site_1:
ECORI: Plants were grown under six following different
environmental regimes in greenhouse, Environment 1)
24oC/17oC day/night, well-watered, with post-anthesis
fertilizer, Environment 2) 24oC/17oC day/night,
well-watered, without post-anthesis fertilizer,
Environment 3) 37oC/17oC day/night, well-watered, without post-anthesis fertilizer,
Environment 3) 37oC/17oC day/night, well-watered, without post-anthesis fertilizer,
Environment 5) 37oC/17oC day/night plus drought, with
post-anthesis fertilizer, Environment 4) 37oC/17oC
day/night, well-watered, without post-anthesis fertilizer,
Environment 5) 37oC/17oC day/night plus drought, without post-anthesis fertilizer,
day/night plus drought, without post-anthesis fertilizer,
day/night plus drought, without post-anthesis fertilizer,
developing wheat grains from the following were excised
and frozen in liquid nitrogen, Environment 1 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 35, 7, 8, 10, 12, 16, 20, 24, 28, 30 DPA Environment 5 at 3, 5, 7, 8, 10, 12, 16, 20, 24, 28, 30 DPA and total RNA was prepared by S.
Altenbach and R. Cronin at USDA-ARS, Albany, CA.
Ilbrary was made using poly (A) RNA, and the cona clones
were in vivo excised to give pBluescript SK(-) phagemids
in the TJ Close lab (Chin, Close, Fenton) at the
University of California, Riverside. Plasmid DNA
preparations and DNA sequencing were performed in the OD
Anderson lab (others)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymorlectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells

/note="Wedror: Lambda Uni_ZAP XR, excised phagemid;
/notes, and for 7 days, then dissected and frozen (Akhunov in J Dvorak Lab). Total RNA was prepared from sheath tissue, equal quantities of RNA were pooled from the two samples, polyA was purified from the pooled RNA, a cDNA library was made, and the cDNA clones were in vivo excised to give pBluescript phagemids in the TJ Close lab at the University of California, Riverside (Akhunov, Chin Choi, Close, Fenton, Kianian, Otto, Simons, Zhang).
Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

Site_1: ECORI; Site_2: XhoI; Spikes at 5, 10, 15 and 20
days after anthesis were heat stressed under two
conditions at Texas Tech University (D. Zhang in HT Nguyrn
lab): (1) at 38 C for 4 hours and (2) 5 days of cyclic
treatment of 38 C for 4 hours. Total RNA and poly(A) RNA
were prepared, a cDNA library was made, and the cDNA
clones were in vivo excised to give pBluescript phagemids
in the TJ Close lab (Choi, Close, Fenton, Malatrasi) at
the University of California, Riverside. Plasmid DNA
preparations and DNA sequencing were performed in the OD
Anderson lab (all other authors)."

Site_1: EcoRI: Site_2: XhoI: Plants were grown under
hydroponic conditions at UC Davis, salt stressed for 12
hours, and for 7 days, then dissected and frozen (Akhunov
in J Dvorak Lab). Total RNA was prepared from sheath
tissue, equal quantities of RNA were pooled from the two
samples, polyA was purified from the pooled from the two
samples, polyA was purified from the pooled from the two
samples, polyA was purified from the pooled from the two
samples, polye pBluescript phagemids in the TJ Close lab
at the University of California, Riverside (Akhunov, Chin
Close, Fenton, Kianian, Otto, Simons, Zhang).
Plasmid DNA preparations and DNA sequencing were
performed in the OD Anderson lab (all other authors)."

/note="The library Gm-r1083 is a sequence-driven, reracked set of 4,992 clones selected from cDNA libraries from various tissues and stages of development of soybean. It represents 117 sequences from the progenitor library Gm-c1009 (from mature roots of 2 month old greenhouse grown 'Williams' soybean plants); 820 sequences from the progenitor library Gm-c1013 (from 2 to 3 week old whole plants of Williams); and 3055 sequences from the progenitor library Gm-c1013 (from 2 to 3 week old whole plants of Williams); and 3055 sequences from the progenitor library from source clones from the different progenitor libraries was used to select singletons, or a representative of each contig, which were reracked Gm-r1083 library were then sequenced at the 3' end. The contig analysis to select unique genes was performed by the laboratory of Ennest Retzel, Center for Computational Genomics and Bioinformatics, University of Minnesota, http://web.ahc.umn.edu/biodata/nsfspy/.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This clone is available through: Incyte Genomics, 4633 World Parkway Litcle St. Louis, Missouri 63134. Note: The corresponding 5' EST from each clone in the Gm-r1083 library is listed in the 'OTHER EST' field. The detailed information on the source library for each clone can also be obtained by referring to the Incyte Genomics clone ID of the original cDNA library that is also listed under 'OTHER EST'."

                                                                                                                                                                                                                                                                            The invention relates to the Moraxella catarrhalis strain ATCC43617

BASB125 protein (AAB60646) and to DNA encoding it (AAF59800). The
Invention also relates to immunogenic fragments of the BASB125 protein,
expression vectors and host cells comprising BASB125 nucleic acids, the
recombinant production of BASB125, vaccine compositions comprising the
BASB125 protein or uncleic acid, an antibody against BASB125, therapeutic
compositions comprising the anti-BASB125 antibody, and a method of
identifying a Moraxella catarrhalis infection via the detection of
BASB125 proteins or antibodies. The vaccine compositions of the invention
are useful as prophylactic or therapeutic agents against Moraxella
catarrhalis infections in mammals, particularly humans. Moraxella
catarrhalis is a Gram negative bacterium frequently isolated from the
human upper respiratory tract, which is responsible for several
pathological conditions. It is responsible for about 15% of otitis media
cases in children (which can lead to temporary or permanent hearing
loss). It also causes pneumonia in elderly people, and sluusitis,
cases in children (which can lead to temporary or permanent hearing
loss). It also causes pneumonia in elderly people, and sluusitis,
cosocomial infections and, less frequently, invasive diseases. BASB125
proteins or nucleotides may additionally be used in screening for novel
antibacterial compounds, and in the diagnosis and steging of infections.
The present sequence represents DNA encoding the Moraxella catarrhalis
strain ATCC43617 BASB125 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 GCAAGTACCCCTGAAAGCAATCCAAAAAACAGTTCTGCTAATTTAACCACCAGCTTAAATC 120

The present invention relates to a Moraxella catarrhalis genomic library comprising of a combination of 41 nucleic acid molecules (see AAF28514-AAF28554). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarrhalis (Branhamella catarrhalis) is a large aerobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarrhalis is known to cause acute, localised infections such as ottlis media, sinusitis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis
                                                                                                                                                                                                                                                                                                                                                                                                            Genomic library; bacteria; human upper airway; otitis medla; sinusitis; bronchopulmonary; endocarditis; meningitis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0969

polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseriab bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy; ds.

represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ5457 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                151 ATGAATAAAACCTTGTCTATT-----TTGCCGGTGGCAATCTTACTCGGCGGCTGC 201

Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B: against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, particularly organism specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              represent specifically claimed Nelseria meningitidis genomic DNA agequences. AAA81260 to AAA81303 and AAB25620 to AAB25663 represent Nelsezria DNA sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA81321 represent PCR primers used in the isolation of Nelsezria meningitidis DNA sequences; and AAA81322 to AAA81452 represent Nelsezria meningitidis DNA sequences; and AAA81322 to AAA81452 represent Nelsezria meningitidis MenB polynucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition. The composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than
                                                                                                                                                                                                                                                                                                     Neisseria meningitidis; Neisseria gonorrheae; genome; immunogenic; antigen; vaccine; diagnosis; infection; antibacterial; identification; Meningococcus B; MenB; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated nucleotide sequences of Neisseria meningitidis which can be used in the diagnosis and treatment of N. meningitidis infection and other Neisserial infections, for example, N.gonorrhoea -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613 represent fragments of the NMB genomic sequence, as the sequence was too long to go in a record on its own it was split into 8 sequences which overlap each other at the beginning and end of each sequence by 49980 bp (i.e. the last 49980 bp of AAF21544 is repeated at the beginning of AAF21607, the last 49980 bp of AAF215607 are repeated at the beginning of AAF21608, and so on). AAF21545 to AAF21588 encode the Neisseria proteins given in AAB58550 to AAB58593, and AAF21589 to AAF21608 represent PCR primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have attained and an each of a minbacterial activity, and can be used in vaccines and gene therapy. Neisseria nucleic acids, proteins and/or antibodies which bluds to the proteins can be used in compositions for treating or preventing infection due to Neisserial bacteria or as a diagnostic reagent for detecting the presence of Neisserial activity or as a diagnostic reagent to Neisserial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 bacteria. Computers, computer memory, computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the outer membrane proteins currently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DD 163909 CTGGCTCCGTCCACGCGCAATCAGGCACTTGCCGCCTGACCGCCAAAACGGTTTCCGCC 163850

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414

Crepresent specifically claimed Neisseria menigitidis genomic DNA sequences; AAA81260 to AAA812620 to AAA825663 represent corresponding proteins; AAA81254 to AAA81259 and AAA81301 represent PCR primers used in the sequences; and AAA8132 to AAA81452 represent Meisseria menigitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria menigitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria menigitidis MenB polynuclectide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences; protein sequences, and antibodies gainst them, can be used in the manufacture of a composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; condyor against all pathogenic Neisseriae. Identification of sequences from the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious CM Melivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete conserved proportanically or an integer conserved from which may be presumed targets for the immune system and which was not antigened or surface exposed proteins that may be presumed targets for the immune system and which was not antigened or surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Scarlato V;

and polypeptides. AA254537 to AA254576 and AA254616 to AA255473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, and compositions of immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polypurcleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          381
